

Practice Question

Using Docker Compose, write a **docker-compose.yml** file to deploy a **WordPress application with a MySQL database** using the images WordPress and MySQL. The configuration should include **version, services, volumes, and networks**, and define environment variables such as **MYSQL_ROOT_PASSWORD, MYSQL_DATABASE, MYSQL_USER, and MYSQL_PASSWORD** for the database service. Configure **port mapping** to access WordPress on **port 8080 of the host**, establish a persistent volume for database storage, and ensure **service dependency ordering** so that the WordPress service starts after the MySQL service.
